

METHOD AND SYSTEM FOR TRANSFERRING FILES FROM PRIMARY SYSTEM TO SECONDARY SYSTEMS

5

Abstract of the Disclosure

A method and system for transferring one or more sequentially ordered data files to a plurality of secondary systems that respond after receipt of each file. A clear-to-send (CTS) flag is maintained for each of the secondary systems. A sequence broker reads a clear-to-send flag and, if the CTS flag is asserted, issues a transfer command to a transmit module to transmit a next data file to the secondary system. The sequence broker reads a status file associated with a secondary system and determines which data file, if any, is to be transferred. The sequence broker receives invoking commands from a clear-to-send broker and/or an invoking module for invoking the transfer process.
